Engineered for the highest availability

HP Integrity NonStop family of systems
HP Integrity NonStop family of systems

In a world that never stops, many enterprises absolutely can’t afford to be unavailable—for any reason. That’s where the unique value of NonStop comes in, with fully integrated, fault-tolerant systems delivering the highest availability, massive scalability, and operational efficiency. And, now offering the flexibility and choice of an unparalleled family of systems.

HP Integrity NonStop for industries that never stop.

Engineered for the highest availability level

In this mission-critical environment, business processing, online transaction processing (OLTP), and enterprise databases are the most-critical workloads to ongoing success—and are driving the need for workload-optimized, proven technology that can deliver continuous business and lower risk.

When availability matters, it’s time for a new compute approach.

HP Integrity NonStop is designed specifically for the very highest availability level. According to the IDC Availability Level 4 definition, that means business processes continue as before.

“AL4 defines true fault tolerance, enabling continuous data processing, even in the event of the failure of one hardware or software component. The end user experiences no perceived interruption based on the use of fault-tolerant servers. In this level, the combination of multiple hardware and software components allow a near-instantaneous failover to alternate resources so that business processing continues as before without interruption.”

– Kuba Stolarski, IDC Enterprise Platforms

“In solving the difficult problem of fault tolerance to the degree it has today with modern, open NonStop servers, HP’s engineers provided us with a server that not only is highly available, but can scale well past any other architecture... the loosely-coupled, shared-nothing, MPP capabilities of the HP NonStop server remain unique to this day... As has always been the case with NonStop, its relevance for users transcends time—it’s never old. It’s timeless.”

– Richard Buckle, CEO, Pyalla Technologies, 2014

That means no interruption of work, no transactions lost, and no degradation in performance. For nearly four decades, the HP NonStop architecture remains the ideal choice when there’s a need for the highest level of availability and reliability—in compute environments that require continuous business.
Fully virtualized integrated stack

The HP Integrity NonStop technology delivers true business resiliency with a highly integrated stack of hardware, software, database, and application services—providing the foundation that HP Integrity NonStop mission-critical customers continue to rely on.

- Continuous availability—delivering instant, continuous access to secure, accurate data
- Lowest TCO in class\(^3\)—reducing complexity and operating costs
- Real-time database—handling high-volume transaction processing and data warehouse environments
- Data integrity—ensuring transaction integrity and reliable handling of data
- Massive scalability—enabling near-linear scaling without degradation
- Standard and modern—leveraging the economies of standards-based, modular computing, and modern software development environments
- End-to-end security—providing sophisticated protection of resources and data

HP Integrity NonStop systems are architected with built-in clustering, workload balancing, and online management to deliver continuous application availability and meet the most stringent uptime SLAs. HP Integrity NonStop systems scale up to 16 NonStop CPUs within a single system (node), each running its own copy of the NonStop OS, and scale out to 4,080 NonStop CPUs on 255 networked NonStop nodes. These capabilities enable an environment that pools and optimizes all resources at the application level. Processing capacity, storage, and network resources are shared transparently to the end user.

The proven reliability, and virtually unlimited scalability of HP Integrity NonStop is enabled by the NonStop Operating System, which combines the scalability of shared-nothing, massively parallel processing with industry-leading application availability, uncompromising data integrity, and support for key industry standard application programming interfaces (APIs) and services. It is this tightly integrated hardware and software architecture, combining hardware fault tolerance and software process-pair fault tolerance that delivers the very highest availability level.

Architectural choice without compromise

For decades, enterprises have trusted NonStop systems to power mission-critical 24x7 solutions, recognizing the distinct advantages of unmatched continuous availability and scalability. And now, HP is offering the flexibility and choice of an unparalleled portfolio of HP Integrity NonStop fault-tolerant systems for high-value business workloads and customer-facing applications—each with the same NonStop fundamentals.

Extending the HP Integrity NonStop brand

The HP Integrity NonStop product family of factory-integrated, fully tested, and verified hardware and software systems can be deployed on either the Intel® Itanium® architecture of the renamed HP Integrity NonStop i platform or the Intel® Xeon® processors of the new HP Integrity NonStop X platform.

NonStop has always adopted the best technology available to meet customer needs—and has successfully transitioned the NonStop software stack several times to new processor technologies. With the HP Integrity NonStop X, HP is redefining continuous availability and scalability for x86. This new family of NonStop X systems is the only fully integrated, fault-tolerant compute for continuously available x86.

The addition of NonStop X provides current NonStop customers with the flexibility to confidently make continued investments in their current Intel Itanium-based HP Integrity NonStop i systems or in the future, to migrate to the NonStop X platform.

New possibilities: HP Integrity NonStop X

The introduction of the HP Integrity NonStop X family, offered with the L-series version of the NonStop OS, extends the 100 percent fault-tolerant HP Integrity NonStop platform to include the x86 architecture while delivering the same high level of availability, massive scalability, data integrity and low total cost of ownership (TCO). The HP Integrity NonStop X systems are powered by Intel Xeon E5-2600 v2 series processors and are built upon an industry-standard InfiniBand system interconnect that provides up to 56 Gbps bidirectional-bandwidth for extreme scalability, fabric flexibility, high throughput, and low latency.

HP Integrity NonStop X NS7 X1

Representing the high-end of the HP Integrity NonStop X family, the HP Integrity NonStop X NS7 X1 offers 2, 4 or 6-core software licensing options with more than double the performance capacity licensed at 6-cores when compared to the HP Integrity NonStop BladeSystem NB56000c licensed at 4 cores The NS7 X1 combines the economics of newly enhanced standards-based, modular computing with the trusted 24x7 fault-tolerant availability and data integrity of the HP Integrity NonStop architecture. The continuous availability, manageability, and development features of HP Integrity NonStop result in a low total cost of ownership (TCO) for hosting mission-critical applications.

Powered by Intel Xeon processors

The HP Integrity NonStop X NS7 X1, built on proven HP ProLiant BL460c server blades, supports up to 192 GB of memory per NonStop CPU, with single system (node) maximum memory capacity greater than 3 TB. The use of half-height server blades connected by InfiniBand enables the NS7 X1 to double the NonStop CPU density within a single c7000 enclosure.

InfiniBand for a 25 times increase in system interconnect capacity

At the heart of the NS7 X1 is a system interconnect based upon industry standard InfiniBand. The NS7 X1 leverages the modular efficiencies of the industry-leading HP BladeSystem c7000 Platinum Enclosure with 4X FDR (Fourteen Data Rate) InfiniBand double-wide switches to create the foundation for the NS7 X1 system interconnect with a dual fault-tolerant switched fabric.

The NS7 X1 with the Cluster I/O Modules (CLIMs) provides significant I/O configuration flexibility with IP and Telco CLIMs for communications support and the Storage CLIM, which serves as a controller to attach hard disk drives (HDDs), solid state drives (SSDs), HP enterprise storage disk arrays, and tapes.

“As customers move to more acceptance of things like Linux in the data center and cloud-based applications, they realize that portions of their application world still need NonStop levels of availability that can’t be achieved using other models. I’m excited about the prospect of working with these new customers and partners.”

– Randy Meyer, VP and GM, Mission Critical Servers, HP Servers
**HP Integrity NonStop X NS3 X1**
The NS3 X1 system is the most recent addition to the HP Integrity NonStop entry-class systems. Available with two or four NonStop CPUs, the NS3 X1 provides the flexibility to choose either 1 or 2-core software licensing per NonStop CPU. Built to take advantage of the same InfiniBand double-wide switches for the system interconnect as the high-end NonStop X systems and powered by Intel Xeon processors, the NS3 X1 supports up to 64 GB of memory per NonStop CPU.

**Providing uninterrupted access to information and services**
The NS3 X1 system can be configured with two or four NonStop CPUs in a factory-integrated, fully-tested and verified configuration and provides significant I/O configuration flexibility via Ethernet with Entry-class IP Cluster I/O Modules (CLIMs) or with Entry-class Telco CLIMs which support M3UA, Diameter, and Session Initiation Protocol (SIP) protocols. Disk storage is managed by Entry-class Storage CLIMs. These powerful I/O adapters provide evenly matched performance for the NS3 X1 platform as they decrease the load on the host processor to balance overall performance, and shorten response times.

**The advantage of the NonStop software stack**
HP Integrity NonStop systems have been designed from day one with an integrated software stack that supports fault tolerance. HP Integrity NonStop systems are delivered to customers as a fully tested and verified hardware and software solution for out-of-the-box efficiency.

The HP Integrity NonStop X is offered with the L-series version of the NonStop Operating System. The NonStop X software stack that has been optimized to take advantage of the x86 architecture and use InfiniBand technology to improve software performance throughout the system. Security and time synchronization software are included with the NonStop OS. HP NonStop SQL/MX and SQL/MP database products are both available on NonStop X with all the latest features for massive scalability. Middleware products are available, as are Java and Java-related frameworks. The NonStop Development Environment for Eclipse (NSDEE) and compilers were enhanced with x86 architecture in mind. Customers that are new to NonStop will find the NonStop Eclipse Development Environment friendly and familiar to their application development efforts on other platforms.

**Running existing NonStop applications on NonStop X**
Most existing non-native TNS (Tandem NonStop CISC) applications will run on the NonStop X architecture without change can be accelerated to take advantage of the new system’s performance using the new NonStop X accelerator. Native Intel Itanium applications can take advantage of the new NonStop X compilers and with a simple recompilation, run on the new platform, requiring few, if any source code changes.

NonStop X is a high performance environment that fits comfortably into your existing data center, is ready for your mission-critical applications, and is 100 percent NonStop.
## HP Integrity NonStop i systems at-a-glance

Ultra-robust systems that deliver 24x7 continuous availability, unrivaled data integrity, and the capacity to handle the most-demanding processing-intensive workloads.

HP Integrity NonStop i

HP Integrity NonStop i BladeSystem NB56000c
As the top of the line offering of the HP Integrity NonStop i family, the NB56000c offers 2 or 4-core software licensing options and is built on the proven HP Integrity BL860c i4 server blade powered by Intel Itanium 9500 series processors. It leverages the HP BladeSystem c7000 Platinum Enclosure with fault-tolerant ServerNet double-wide switches and the J-series version of the NonStop OS to greatly improve the computing capacity of the platform.

The NB56000c with the Cluster I/O Modules (CLIMs) provides significant I/O configuration flexibility. The Storage CLIM serves as a controller to attach hard disk drives (HDDs), solid state drives (SSDs), HP enterprise storage disk arrays, and tapes. In addition, it offers integrated volume-level encryption functionality that provides data-at-rest security. Network connectivity is delivered through the IP CLIM, which provides support for IPv6, IPSec, and SCTP. The Telco CLIM supports M3UA, Diameter, and Session Initiation Protocol (SIP) telecommunications protocols. For additional communications connectivity choices, the G16SE is available.

A carrier-grade version of the HP Integrity NonStop i BladeSystem NB56000c-cg is DC-powered and Network Equipment-Building System (NEBS) Level 3 certified to meet telecommunication marketplace requirements. NEBS is the most common set of safety, spatial, and environmental design guidelines applied to telecommunications equipment in the United States.

HP Integrity NonStop i NS2300 and NS2400
The HP Integrity NonStop i NS2300 and NS2400 system family are the entry-class HP Integrity NonStop i systems. Designed to deliver the same high levels of availability and data integrity that all NonStop systems are known, for in a cost-effective manner, both the NS2300 and NS2400 can be configured with two or four NonStop CPUs in a pre-assembled and integrated rack-mount configuration.

The NS2300 system provides the most-affordable price point and is designed to meet the needs of standalone applications and emerging markets. The HP Integrity NonStop i NS2400 systems are ideal for small- to mid-size enterprises in the financial services, healthcare, manufacturing, public sector, and telecommunications industries.

These entry-class systems deliver the highest built-in reliability, availability, and serviceability in the most cost-effective manner by making use of industry-standard components, including the Intel Itanium 9500 series processor.

Modern backup options
With the HP NonStop BackBox solution, customers can build out a complete backup environment to support all of their HP NonStop systems or integrate NonStop into an existing environment with other servers. HP NonStop BackBox software is part of ETI-NET’s family of virtual tape-based products for HP NonStop systems. Unlike other virtual tape products for NonStop, the HP NonStop BackBox management software, catalogs, and metadata are resident on the HP NonStop system, enabling protection via Transaction Management Facility (TMF). The HP NonStop BackBox solution consists of the HP NonStop BackBox host software for H-series or J-series platforms that resides on the HP NonStop system and the Microsoft® Windows®-based BackBox controller software on the HP NonStop BackBox Virtual Tape Controller.
**HP NonStop clusters**

**Massive scalability**
HP Integrity NonStop systems are well-known for extreme scaling, easily handling bursts of transaction processing, end-of-quarter application loads, business changes such as mergers and acquisitions that require expansion in capacity, or adding a large number of customers in a short period of time.

**NonStop X Cluster Solution**
HP Integrity NonStop X Cluster Solution (NSXCS) is a combination of clustering hardware and associated software that makes it easy to cluster multiple NonStop X NS7 systems (nodes) together in a tight interconnection using InfiniBand technology.

- Up to 24 nodes in one, two or three zones utilizing a pair of HP NonStop 4X FDR InfiniBand Cluster Switches per zone, providing up to 56 Gbps bidirectional bandwidth.
- Up to 30 meters node to switch or switch to switch, up to 60 meters between nodes in the same zone and 90 meters maximum distance between nodes interconnected via any two zones.
- Up to 16 NonStop X CPUs per node, enabling a single cluster of up to 384 NonStop X CPUs.

**Expand-over-IP networking**
All HP Integrity NonStop systems support Expand-over-IP networking, using high-speed Gigabit Ethernet links to interconnect multiple NonStop systems over a local or wide area network.

- Up to 255 NonStop systems (nodes), with up to 4,080 NonStop CPUs either co-located or geographically distributed for disaster tolerance.

**HP NonStop BladeCluster Solution**
HP NonStop BladeCluster Solution (NSBCS) is a combination of clustering hardware and associated software to cluster multiple HP Integrity NonStop i systems and previous generation NonStop systems using HP NonStop ServerNet III technology.

- Enables local clusters (zones) up to eight nodes within a data center and up to 410 feet (125 meters) between nodes.

Provides for clustering up to three zones together—for a total of 24 nodes linked in one cluster. The inter-zone distance can be up to 40 miles (65 kilometers).

**HP NonStop software**

**Modern application development environment**
Integrated Development Environments (IDEs) make it easier for most developers to create and maintain application programs. With that in mind, HP NonStop has invested in bringing these modern environments to the NonStop application community.

**Modern frameworks**
There are well over one hundred frameworks available to software developers, most of which are based on a specific language such as Java, C++, or JavaScript. Several of the most widely used open source and free Java frameworks make up the SASH stack, an acronym to describe a set of open source middleware that encourages application objects to be Plain Old Java Objects (POJO)—domain objects that only implement application specific logic.

- Apache MyFaces (presentation services)
- Axis2 (Web services)
- Spring (business services)
- Hibernate (persistence services)

As a result, these open source frameworks have been widely adopted by Java developers, and in many cases have become the de facto technology for developing enterprise Java applications largely replacing EJB technology. HP has tested and certified these frameworks for deployment on HP NonStop. Sample programs, recommended configuration parameter values, and detailed user guides have been published. The Eclipse IDE has optional plug-ins to aid in Java development.
Framework-based applications are container agnostic. Applications can run on a lightweight Web container like Tomcat or on a full-fledged Java EE application server like JBoss Application Server. This allows the choice of deployment server that is best suited for the server platform.

**Modern application development tools**

The NonStop build tools and compilers have been integrated into both the Microsoft Visual Studio with the Enterprise Toolkit (ETK) NonStop Edition and into Eclipse with NonStop Development Environment for Eclipse (NSDEE). These tools, including Certified Java SE Platform (JDK and JVM) and Apache Tomcat, help improve the productivity of new HP NonStop developers. Many optional components and additional tools are available as plug-ins for each IDE.

**Middleware**

From a business perspective, the service-oriented architecture (SOA) model can help IT be more responsive to changing business needs, thereby improving business agility. HP Integrity NonStop can play an important role in an SOA architecture as a first-class platform for the provision of SOA services.

Using the HP Integrity NonStop system in this role brings the values of application and scalability, availability, data integrity, and ease of manageability to SOA services—without special programming.

“Since implementing the HP Integrity NonStop BladeSystem, the average application response time on the Web has been reduced to 10 milliseconds or less. That’s a tremendous improvement to POS transactions and to the consumer experience.”

– Greg Bohn, VP Data Center Operations, Stored Value Solutions

The HP NonStop system SOA product technologies provide the necessary capabilities for service access, invocation, and implementation.

**HP iTP WebServer**

HP iTP WebServer software provides the HTTP and HTTPS protocol service for all the other SOA components. Built on the HP NonStop Transaction Services/Massively Parallel (NonStop TS/MP) infrastructure, iTP WebServer software provides a fault-tolerant and scalable container for Web service execution, hosting both NonStop SOAP and NonStop Servlets for JSP components.

**HP NonStop SOAP**

HP NonStop SOAP software supports the standard SOAP 1.2 protocol. The combination of iTP WebServer and NonStop SOAP software provides the standard SOAP over HTTP protocol for invoking SOA services on the HP Integrity NonStop system. NonStop SOAP is built on HP NonStop TS/MP infrastructure and is fault tolerant and scalable.

**HP NonStop Application Server for Java**

The HP NonStop Application Server for Java (NSASJ) includes the Enterprise JavaBeans (EJB) Container and the Web Container modules of the JBoss AS. The built-in capabilities of Enterprise JavaBeans enable developers to concentrate solely on their business logic, rather than worry about platform dependence and related functionalities such as transaction integrity, data persistence, and availability. NSASJ is designed as an HP NonStop Transaction Services/Massively Parallel (TS/MP) serverclass. Because it is a serverclass, NSASJ is continuously available and offers near-linear scalability on the HP NonStop system.
HP NonStop Servlets for JavaServer Pages (JSP)

HP NonStop Servlets for JSP software is a fortified version of the Apache Tomcat Web container that exhibits NonStop availability and scalability while supporting the standard Java Platform Enterprise Edition (JEE) Servlets and JSP programming models. NonStop Servlets for JSP software runs as a scalable serverclass using the iTP WebServer and NonStop TS/MP infrastructure. This integrated environment transparently inherits the scalability, reliability, and fault tolerance of the HP Integrity NonStop system.

Open source Apache Axis2/Java software can be used in conjunction with the scalable NonStop Servlets for JSP container to implement either Java service adapters or Java SOA business processes. In addition, the JToolkit for NonStop Servers software enables easy access to Pathway servers and Enscribe flat file data from Java-based SOA services.

HP Pathway with NonStop TS/MP

HP Pathway with NonStop TS/MP software provides application server functionality that allows businesses to develop and deploy business-critical OLTP applications on HP Integrity NonStop systems.

Using Pathway enables developers to concentrate on implementing their business logic without having to be concerned about common application services, such as load balancing, communications I/O, memory management, fault tolerance, and threading and scheduling. All these common services are provided by the Pathway application server software.

**Database and transaction management**

HP NonStop SQL is the mainstream database product for the HP Integrity NonStop systems. NonStop SQL has been fundamentally architected as a clustered database system. It is designed to leverage the HP NonStop tightly integrated, shared-nothing, massively parallel platform architecture and deploys the fault-tolerant model for immediate and transparent takeover for unparalleled reliability, availability, and scalability. It supports management of massive, multi-terabyte databases as a single database image and delivers high performance in a cluster environment. HP NonStop SQL provides:

- **Outstanding scalability**—As the size of data volume, number of concurrent users or sessions, and query workloads and complexity for your database grow, you can add more computing power to the NonStop cluster and increase throughput linearly at greater than 98 percent.\(^4\)

- **Continuous availability**—The NonStop platform and NonStop SQL provide out-of-the-box database and application availability. There is no complex configuration required to achieve true 24x7 availability. Routine database administration (DBA) tasks can be done online without requiring the database and application to be brought down.

- **Application portability**—NonStop SQL supports industry standards (ANSI SQL, JDBC, ODBC) as well as numerous extensions to support porting of database applications from other platforms.

\(^4\) Internal lab tests conducted by HP NonStop Advanced Technology Center, March 2011
Automatic load balancing—NonStop SQL offers query and data virtualization capabilities, enabling an environment that pools and optimizes all resources at the application level. With built-in clustering, automatic workload balancing, and online management, organizations using NonStop SQL can seamlessly accommodate rapid growth without adding labor costs, compromising on service levels, or causing user disruption.

Lower database administration costs—NonStop SQL database is distributed among multiple nodes of a cluster and is presented to the DBA and users as a single, clustered database image. The DBA’s tasks are not daunting or time consuming and don’t require highly specialized skills, thus managing a clustered database is no different from managing a non-clustered environment.

“Because fault-tolerant systems deliver resources that are optimized end to end for reliability, availability, and serviceability, the system cannot easily be confused with a more general-purpose system serving a workload with potentially lower business value. Additionally, it’s important to remember that in general, high-availability fault-tolerant systems require less human intervention to restore operations following a failure, with the most common cause for an IT service outage still being human error.”

– Matt Eastwood, Group VP & GM, Enterprise platforms, IDC, 2014

The tight integration between the HP NonStop SQL database management system and the HP NonStop Operating System enables absolute control over a concurrent mixed-workload environment, making the NonStop SQL database unique in effectively handling all types of workloads executing concurrently across a potentially very large cluster. HP NonStop OS plays a critical role in allocating processor, disk, and I/O resources in an environment where competing priorities have to be dynamically monitored and processes deemed to be of the highest priority need to be given precedence. Additionally, many key NonStop SQL database operations take place at the operating system level, which in turn leads to increased efficiencies that have a positive impact on very large database (VLDB) and real-time database performance.

“Customer needs, as well as logistics, change by the minute. We must realize a system capable of delivering the wide range of products on time and without fail to our customers. We (use) HP NonStop servers with their unrivaled reliability and flexibility.”

– Ikuo Ishige, Manager, Computing Center, Yamazaki Baking Company

The ANSI SQL-compliant HP NonStop SQL database can be accessed using Open Database Connectivity (ODBC) 3.0 and Java Database Connectivity (JDBC) Type 4 interfaces from Microsoft Windows and Linux platforms, and an on-platform JDBC Type 2 driver and Open System Services (OSS) ODBC/MX driver. The drivers and ODBC server provide a highly reliable, 24x7 available and scalable connectivity solution that is standards-compliant and engineered for high performance and throughput, and well integrated with HP NonStop database servers.

Transaction management
To ensure database integrity, the HP NonStop Operating System integrates closely with HP NonStop Transaction Management Facility (NonStop TMF) software, which provides distributed two-phase commit protection for global database changes across all affected HP NonStop systems.
HP NonStop TMF software is designed to help protect a database from intentional or accidental damage. With NonStop TMF software, a failure in an application, system, or network component does not result in a corrupted database because of a partially completed database update. Before an update changes the database, an image of every affected record or row is captured in memory and written to an audit log. If any part of an update fails or is programmatically aborted, NonStop TMF software automatically backs out the change in its entirety, returning the database to its state just prior to the start of that change.

**Disaster tolerance**

HP NonStop Remote Database Facility (NonStop RDF) software extends the HP Integrity NonStop system's legendary fault tolerance to disaster tolerance. By geographically dispersing HP NonStop systems, NonStop RDF software allows critical applications to survive a total site failure without specialized programming.

Using the transaction log generated by HP NonStop TMF software, database changes are instantaneously replicated to one or more target systems, no matter how many transactions per second your application generates. If a primary database becomes inaccessible for any reason, processing can continue using the backup database with minimal service disruption or data loss.

**Simplified management and control**

With an eye toward improving TCO, HP offers a comprehensive selection of manageability products and solutions that provide self-management capabilities that can be adapted to customer-specific environments. HP NonStop is managed by HP Systems Insight Manager (SIM), NonStop Essentials, HP IT Performance Suite and other enterprise (e.g., Tivoli, Netcool, Unicenter, Patrol, etc.) and open source management solutions (Nagios, etc.) in heterogeneous enterprise environments. NonStop manageability products can be categorized as follows.

- **HP SIM-related products**—HP Insight Control for NonStop includes HP SIM, HP Insight Control Power Management, and NonStop Software Essentials. These products work together to provide an HP SIM-based single-pane-of-glass management environment for customers. Additional SIM-related products include NonStop Cluster Essentials, NonStop Performance Essentials, NonStop I/O Essentials, and HP Insight Remote Support Advanced.
- **HP IT Performance Suite**—Products for IT strategy, planning and governance, application lifecycle management, IT operations, security intelligence, information management, and business analytics.
- **Serviceability products**—Onboard Administrator (OA), Integrated Lights-Out (iLO), Open System Management (OSM).
- **HP Web ViewPoint-based products**—Web ViewPoint, Pocket ViewPoint, Pathway plug-in, ASAP plug-in, Storage Analyzer plug-in, Event Analyzer plug-in.
- **Performance Management Bundle**—Measure, Guardian Performance Analyzer (GPA), ViewSys, NonStop Performance Data Collector (PDC), Open Database, Data Browser, NonStop Performance Reporter (NPR), Disk Prospector (DiskPro), System Performance Analyzer (SPA), Pathway View.
- **Other manageability products**—ASAP, RPM, TimeSync Reload Analyzer (TRA) Enform Optimizer, TCM, Nagios.
HP Systems Insight Manager (HP SIM)
HP SIM unifies the management of servers, storage, and networking devices. It gives
customers a single tool for managing virtual and physical infrastructures. HP Systems
Insight Manager builds on field-proven technology that supports Microsoft Windows, Linux,
and UNIX® operating systems and provides virtualization and automation capabilities, with
plug-ins that complement and extend management solutions for HP NonStop systems.

HP NonStop Essentials
HP NonStop Essentials plug-ins provide integration between HP Systems Insight Manager
and HP NonStop. HP NonStop Cluster Essentials provides the management solution for both
homogeneous clusters of HP NonStop systems and heterogeneous clusters of NonStop
and Linux systems. It provides integrated solutions for health monitoring, alert monitoring,
event monitoring, integrated provisioning, virtualized configuration and control, unified
account management, and software consistency checks.

HP NonStop Performance Essentials seamlessly integrates with HP NonStop Cluster
Essentials to provide real-time, as well as trend-monitoring, solutions for both
homogeneous clusters of HP NonStop systems and heterogeneous clusters of NonStop and
Linux systems.

NonStop I/O Essentials provides the management solution for managing the I/O subsystem
of HP NonStop systems—reducing training costs and operator-induced errors.

NonStop Software Essentials is a software installation and management tool for all NonStop
systems. It modernizes NonStop software management and is an HP SIM plug-in that assists
in planning, configuring, and installing HP, third-party, and customer-developed NonStop
software packages.

HP IT Performance Suite
HP IT Performance Suite is an open, modular platform designed to enable integrated
continuous lifecycle management that automates and optimizes planning, delivery,
deployment, performance, availability, and security. It simplifies operation with a complete
self-service environment that provisions and configures IaaS from public or private clouds
and your middleware and applications stack.

HP IT Performance Suite provides information lifecycle management solutions to help
manage all information—structured and unstructured—and unified security layers that
integrate with operations monitoring, executive views, and automated response to threats
for complete security.

HP NonStop is supported in key HP IT Performance Suite products such as Application
Lifecycle Management 11, ArcSight ESM, ArcSight Logger, Business Process Insight
(BPI), Discovery and Dependency Mapping Advanced Addition (DDMA), Fortify Source
Code Analyzer (SCA), Fortify Real-Time Analyzer (RTA), LoadRunner, Network Node
Manager i (NNM), Operations Manager, Operations Manager i, Operations Orchestration
(OD), Performance Center, Quality Center, Service Manager, SiteScope, Sprinter, Storage
Essentials, TransactionVision (TV), and Universal CMDB (UCMDB).

Security
In today’s interconnected world, companies across all industries need to demonstrate that
they maintain confidentiality, integrity, and availability—for both their customers’ data and
their own. Additionally, overlapping standards and regulations continue to emerge all over
the world.

This change in the business environment has made HP NonStop customers even more aware
of security needs for their individual businesses, and more demanding of sophisticated
protection for their resources and data. HP is meeting this demand by investing in new
products and product enhancements that provide the security capabilities customers need.
On-platform
On-platform security is focused on reducing insider data theft and misuse by identifying users, controlling their access to sensitive data and system resources, and tracking their activities on the system.

HP Safeguard security software provides flexible authentication, authorization, and audit services based on a subject/object access control model that allows enterprises to appropriately restrict authenticated users’ access to NonStop Guardian system resources. Optional XYGATE Access Control and XYGATE User Authentication products have been added to the HP NonStop portfolio to extend Safeguard’s capabilities and enhance on-platform security.

Data in motion
Customers also need options for insuring that sensitive data is protected when it is being moved. The HP NonStop system includes HP NonStop SSH and HP NonStop SSL bundled with the HP NonStop Operating System to deliver end-to-end communications security, strong authentication, and auditing for system administration, file transfer, and applications connectivity.

Data at rest
Optionally, HP offers HP NonStop Volume Level Encryption, a fully integrated encryption solution for data at rest on disk and tape media for HP NonStop multi-core systems. In addition, integration with HP Enterprise Secure Key Manager provides high-availability encryption key generation and retrieval, and storage of millions of encryption keys, while helping to meet PCI/DSS requirements for key management.

Compliance
HP is committed to helping customers achieve and demonstrate security compliance on their HP Integrity NonStop systems. To achieve this, HP offers two products specifically targeted to help customers with security auditing and compliance.

XYGATE Compliance PRO allows enterprises to analyze and establish appropriate security settings on their system in order to close security vulnerabilities and deploy best security practices on the system.

XYGATE Merged Audit allows enterprises to consolidate event logs and enables real-time reporting and alerting about security events that have occurred. These NonStop security events can be integrated with HP ArcSight SIEM using XYGATE Merged Audit. Use of HP ArcSight SIEM allows businesses to view all security events across their entire enterprise from a single interface.

Vertical applications
Many industries, such as financial services, telecommunications, manufacturing, and healthcare are leading the way in delivering a continuous business environment—and HP Integrity NonStop is there at the heart of their business.

- Processing over 1.4 billion credit and debit cards with a charge volume of over $3.6 trillion USD
- Servicing over 450 million subscribers in advanced Telco network applications such as Home Location Register (HLR), Home Subscriber Server (HSS), and other network applications
- Powering mission-critical applications at the leading global manufacturers
- Supporting several of the world’s leading medical institutions

As the de facto platform for card processing and electronic funds transfer (EFT) in the financial services industry, HP Integrity NonStop can quickly scale resources for real-time, high-volume transactions. Global financial services leaders have improved bottom-line results from the comprehensive HP portfolio of technology-based and services-led solutions, including applications from HP partners such as ACI, AJB, BPC, ECS, FIS, Lusis, Opsol, and ReD.
HP Technology Services

HP Technology Services help build an infrastructure that is reliable, highly available, and rooted in best practices. We offer a support experience that is proactive, personalized, and simplified—delivering support when and how you need. HP recommends the following services for HP Integrity NonStop systems:

- **HP Critical Service**
  High performance reactive and proactive support designed to minimize downtime. It offers an assigned support team, which includes an Account Support Manager (ASM). This service offers access to HP’s Global Mission Critical Solution Center, 24x7 HW and SW support, 6-hour Call-to-Repair commitment, enhanced parts inventory and accelerated escalation management.

- **HP Proactive 24**
  Provides proactive and reactive support delivered under the direction of an ASM. It offers 24x7 HW support with 4-hour onsite response, 24x7 SW support with 2-hour response and flexible call submittal.

- **HP Installation and Start-up Services**
  This service provides efficient and effective deployment of HP hardware components.

The platform for continuous business

If you require support for high volumes of online transactions, continuous access to information, and rational infrastructure and operational costs, HP Integrity NonStop can help you address these critical enterprise business issues.

- The confidence that your business will be continuously on
- The agility to quickly respond to ever-changing market and IT demands
- The ability to implement new business processes and keep pace with new initiatives
- The elimination of complexity and cost
- The protection of data and resources

The HP Integrity NonStop platform offers so much that is new, and continues to provide the highest levels of availability and near-linear scalability of any server in today’s marketplace—with hardware, operating system, database, software, and applications packaged as part of a well-integrated stack.

For real-time processing of ATM or payment transactions, telecommunications service, follow-the-sun access to operational data, or on-demand health information, you can trust it will be available.
