Product overview

The HPE 5120 SI Switch Series comprises intelligent, fully managed Gigabit Ethernet switches that provide high performance, high port density, and simplified installation to improve the value of your network infrastructure investment. The 5120 SI Switch Series is enhanced for the access layer in enterprise networks that require Gigabit Ethernet to the desktop or at the distribution layer in metropolitan area networks (MANs). Wire-speed forwarding delivers more effective throughput and the bandwidth necessary for mission-critical data and high-speed communications. As part of their comprehensive security control, 5120 SI switches employ IEEE 802.1X authentication to identify users who attempt to access the network. These switches are highly reliable, providing redundancy while eliminating loops in the network. They also offer a range of management protocols to simplify network administration.

  detects data link layer problems that occurred in the “last mile” using the IEEE 802.3ah OAM standard; monitors the status of the link between two devices

• Power over Ethernet Plus (PoE+) support  
  provides 30 W power for connected devices, simplifies deployment, and dramatically reduces installation costs by helping to eliminate the time and cost involved in supplying local power at each access point location

• IPv6  
  – IPv6 host  
    enables switches to be managed and deployed at the IPv6 network’s edge  
  – Dual stack (IPv4 and IPv6 using BIS)  
    allows IPv4 hosts to communicate with IPv6 hosts  
  – IPv6 ACL  
    for filtering IPv6 network traffic
**Performance**
- Nonblocking architecture
  
  up to 104 Gb/s nonblocking switching fabric provides wirespeed switching with up to 77.4 million pps throughput
- Hardware-based wirespeed access control lists (ACLs)
  
  help provide high levels of security and ease of administration without impacting network performance with a feature-rich TCAM-based ACL implementation

**Resiliency and high availability**
- Separate data and control paths
  
  increases security and performance
- Spanning Tree/MSTP, RSTP
  
  provide redundant links while preventing network loops
- IEEE 802.3ad Link Aggregation Control Protocol (LACP)
  
  supports up to 26 trunks, each with 8 links per trunk; supports static or dynamic groups
- Smart link
  
  allows 50 ms failover between links

### Notes

Idle power is the actual power consumption of the device with no ports connected. Maximum power rating and maximum heat dissipation are the worst-case theoretical maximum numbers provided for planning the infrastructure with fully loaded PoE (if equipped), 100% traffic, all ports plugged in, and all modules populated.

PoE Power is the power supplied by the internal power supply, it is dependent on the type and quantity of power supplies and may be supplemented with the use of a External Power Supply (EPS).
